Abstract not available for AU6292698

Abstract of corresponding document: **WO9832713**

The invention concerns a lightweight material containing blown perlite, alkali silicates and optionally additives of hardeners for aqueous alkali silicates, the expanded perlite having a grain size of between 0.8 and 6 mm. The material further contains a water-repelling agent, and the apparent densities range from 60 to 500 kg/m³.
